CD3/CD28 Activation

T cell activation is essential for immune response, involving antigen recognition and subsequent activation. This process requires three signals: Signal 1 from the T cell receptor (TCR) binding to antigens presented by the major histocompatibility complex (MHC) on antigen-presenting cells (APCs), Signal 2 from co-stimulatory molecules like CD28 on T cells binding to CD80 or CD86 on APCs, and Signal 3 from cytokines that guide T cell differentiation and proliferation. Abnova's CD3/CD28 IsoActiveBeads™ and CD3/CD28 ActiveBeads™ mimic these signals to activate T cells *in vitro*. These beads are coated with antibodies targeting CD3 and CD28 on T cells, providing Signals 1 and 2 to prompt activation, proliferation, and differentiation. They continuously supply activation signals, enabling the production of large numbers of activated T cells over several days to weeks. The beads can be removed using a magnetic separator and are valuable in T cell research, particularly for studying tumors, autoimmune diseases, and regulatory dysfunctions.

Advantages

- High Efficiency: Consistently achieving high rates of T-cell expansion.
- Contamination-Free: Using magnetic beads to support a clean process.
- Preserved Functionality: Maintaining activated T cells *in vivo*-like function.
- Long-term Utility: Activating and expanding T cells with Human or Mouse CD3/CD28 ActiveBeads™ for three days to several weeks.
- No Feeder Cell: Easily expanding T cells without feeder cells.
